

CareerCompass – AI Career Guidance Assistant

Problem Statement

Choosing the right career is one of the biggest challenges faced by students after Class 10, Class 12, or graduation. Many students are unsure about which course matches their interests, skills, and future goals. Although information is available on the internet, it is often scattered across different websites, making it difficult to compare options and make informed decisions.

Professional career counselling is not always affordable or accessible, especially for students in remote areas. As a result, many students rely on incomplete information or advice from others, which can lead to unsuitable career choices.

CareerCompass aims to solve this problem by providing an AI-powered career guidance assistant built using IBM watsonx Assistant and the IBM Granite Foundation Model. The assistant answers career-related questions, explains educational pathways, recommends suitable career options, and provides simple, reliable guidance through an easy-to-use website that students can access anytime.
